

LABLAB.AI × ASSEMBLYAI VOICE AGENT HACKATHON · 2026

# Second Listen

*“You said it out loud. You didn’t realize it was a signal.”*

A voice agent for post-investment risk management.

# Every fund tracks metrics. Nobody captures what they hear.

## DASHBOARD SIGNALS

Revenue decline, runway under six months, covenant breaches. Visible in KPI reports, already covered by portfolio monitoring tools.

## CONVERSATION SIGNALS

A CFO leaving, grant money quietly moved to payroll, a lawsuit mentioned in passing. They exist only in conversation.

# **A signal is freshest at the moment it is spoken.**

By the time a quarterly review form gets filled, memory has eaten half the evidence — the quote, the date, who said it, what was promised.

What survives is a summary nobody can audit. What is lost is exactly the thing that should have triggered escalation.

# A two-minute debrief that ends in evidence, not notes.

- 1 **Debrief** — after a founder call, board meeting or site visit, press and talk for about two minutes, casually retelling what happened.
- 2 **Interrogate** — the agent follows the playbook's escalation checklist, one question at a time: who covers finance since the CFO left, was there written approval for moving the grant money.
- 3 **Record** — an evidence table with timestamped quotes, a risk-ledger update, escalation flags, and a follow-up note with an owner and a deadline.

# Generic models summarize. This one knows what to ask.

We took a real post-investment risk-grading playbook — three-level grading, five evidence dimensions, an escalation checklist — and compiled it into skills the agent runs live.

- File every signal **with the quote it came from**.
- Escalate anything that crosses a **red line** in the checklist.
- Turn each answer into an **action with an owner and a due date**.

# Everything in the demo is a real run.

The 3:44 submission video is one uncut second check-in: the agent reopens last week's follow-ups one at a time, then files what is new.

- **Prior follow-ups reopened** by the agent at the opening, not by the investor.
- **Signal filed with its quote** — evidence you can audit back to the second it was said.
- **Agreed action created** with owner, due date and agreed-at timestamp — two reminders set on the same call.

# Next week, it opens with last week's promises.

Each company keeps one JSON history file — no database, no vector store. Commitments carry an owner and a deadline; recorded signals stop the agent from asking twice.

*“Before we cover anything new — let’s close one prior follow-up at a time.”*

# Same playbook, on a recording.

Not every debrief happens live. Upload a recorded call or a voice memo: Universal-2 transcribes it and the same playbook returns a signal list, escalation flags and follow-up questions.

**Chinese recordings work today.** The live path speaks English; the upload path reads Chinese — the two engines cover each other's gap.

---

*Demo case: an uploaded debrief returns 9 signals, 7 to review, 9 open questions — including a compliance red line and funds used outside the agreed purpose.*

# One WebSocket for the live path.

## LIVE DEBRIEF

AssemblyAI Voice Agent API — STT + LLM + TTS, turn detection, barge-in and JSON-schema tool calling over a single connection.

## UPLOAD ANALYSIS

AssemblyAI Universal-2 transcription plus a pluggable OpenAI-compatible LLM. Same playbook, two paths.

# Who pays, and why.

The buyer is the post-investment or risk function of a fund or an investment platform — the team that already owns a risk-grading system on paper, but has no way to feed it from conversations.

Post-investment is the first slot, not the only one. The same slot accepts a legal case checklist, a credit due-diligence script or a safety inspection list.

# The hard part was never transcription.

---

Transcription is solved. Knowing what matters, what needs follow-up, and what you are exposed to if nobody wrote it down — that is not.

Second Listen is a domain playbook compiled into a voice agent: file the signal, cite the quote, chase the owner. Open method, running on AssemblyAI.

---

*Everything from this call is now on the record: the signals, the quote behind each one, and the follow-ups — each with an owner and a due date.*
